

CEEMA – HUMAN PERFORMANCE STACK™

Sales Readiness Index (SRI)

Strategic Performance Diagnostic

88

/ 125

DEVELOPING READINESS

Prepared for ABC Enterprises
20 February 2026

Executive Summary

The Sales Readiness Index reflects a structurally capable but uneven performance architecture. Execution strength is pronounced, indicating strong bias toward action and operational delivery. However, relative compression within the Attention lever suggests diminishing strategic focus consistency across cycles. This asymmetry introduces controlled performance volatility — progress is made, but not always sequenced optimally. Variance analysis indicates moderate structural skew, meaning leverage exists but remains partially unrealized. With calibrated attention discipline and tighter strategic sequencing, the existing execution strength can convert into compounding performance acceleration. The system is not weak; it is under-aligned. Precision refinement rather than overhaul will unlock disproportionate gains.

Performance Lever Breakdown

Cognition Cognitive architecture demonstrates solid strategic reasoning capacity, though forward planning occasionally outpaces structured sequencing discipline.	19 / 25		MODERATE
Emotion Emotional regulation remains stable under routine pressure; resilience profile suggests dependable internal state management.	17 / 25		MODERATE
Attention Attention bandwidth appears fragmented across competing operational demands, reducing compounding focus leverage.	14 / 25		MODERATE
